

# Particle Physics from Tevatron to LHC: what we know and what we hope to discover

*Beate Heinemann, UC Berkeley and LBNL  
Università di Pisa, February 2010*

# Outline

- **Introduction**
  - Outstanding problems in particle physics
    - and the role of hadron colliders
  - Current and near future colliders: Tevatron and LHC
- **Standard Model Measurements**
  - Hadron-hadron collisions
  - Cross Section Measurements of jets, W/Z bosons and top quarks
- **Constraints on and Searches for the Higgs Boson**
  - W boson and Top quark mass measurements
  - Standard Model Higgs Boson
- **Searches for New Physics**
  - Supersymmetry
  - Higgs Bosons beyond the Standard Model
  - High Mass Resonances (Extra Dimensions etc.)
- **First Results from the 2009 LHC run**

# **Precision Measurement of Electroweak Sector of the Standard Model**

- **W boson mass**
- **Top quark mass**
- **Implications for the Higgs boson**

# The W boson, the top quark and the Higgs boson

- Top quark is the heaviest known fundamental particle
  - Today:  $m_{\text{top}} = 173.1 \pm 1.3 \text{ GeV}$
  - Run 1:  $m_{\text{top}} = 178 \pm 4.3 \text{ GeV}/c^2$
  - Is this large mass telling us something about electroweak symmetry breaking?
    - Top yukawa coupling:
    - $\langle H \rangle / (\sqrt{2} m_{\text{top}}) = 1.005 \pm 0.008$
- Masses related through radiative corrections:
  - $m_W \sim M_{\text{top}}^2$
  - $m_W \sim \ln(m_H)$
- If there are new particles the relation might change:
  - Precision measurement of top quark and W boson mass can reveal new physics

# W Boson mass

- Real **precision** measurement:
  - LEP:  $M_W = 80.367 \pm 0.033 \text{ GeV}/c^2$
  - Precision: 0.04%
    - => Very challenging!
- Main measurement ingredients:
  - **Lepton  $p_T$**
  - **Hadronic recoil** parallel to lepton:  $u_{||}$
- $Z \rightarrow \ell\ell$  superb calibration sample:
  - but statistically limited:
    - About a factor 10 less Z's than W's
    - Most systematic uncertainties are related to size of Z sample
      - Will scale with  $1/\sqrt{N_Z}$  ( $=1/\sqrt{L}$ )

$$m_T = \sqrt{2p_T^l \cancel{p}_T (1 - \cos \Delta\phi)},$$

$$\cancel{p}_T \approx |p_T + u_{||}|$$

$$m_T \approx 2p_T \sqrt{1 + u_{||}/p_T} \approx 2p_T + u_{||}$$

# Lepton Momentum Scale and Resolution

- Systematic uncertainty on momentum scale: 0.04%

# Systematic Uncertainties

| $m_T$ Fit Uncertainties  |                        |                      |             |
|--------------------------|------------------------|----------------------|-------------|
| Source                   | $W \rightarrow \mu\nu$ | $W \rightarrow e\nu$ | Correlation |
| Tracker Momentum Scale   | 17                     | 17                   | 100%        |
| Calorimeter Energy Scale | 0                      | 25                   | 0%          |
| Lepton Resolution        | 3                      | 9                    | 0%          |
| Lepton Efficiency        | 1                      | 3                    | 0%          |
| Lepton Tower Removal     | 5                      | 8                    | 100%        |
| Recoil Scale             | 9                      | 9                    | 100%        |
| Recoil Resolution        | 7                      | 7                    | 100%        |
| Backgrounds              | 9                      | 8                    | 0%          |
| PDFs                     | 11                     | 11                   | 100%        |
| $W$ Boson $p_T$          | 3                      | 3                    | 100%        |
| Photon Radiation         | 12                     | 11                   | 100%        |
| Statistical              | 54                     | 48                   | 0%          |
| Total                    | 60                     | 62                   | -           |

Limited by data statistics

Limited by data and theoretical understanding

TABLE IX: Uncertainties in units of MeV on the transverse mass fit for  $m_W$  in the  $W \rightarrow \mu\nu$  and  $W \rightarrow e\nu$  samples.

- Overall uncertainty 60 MeV for both analyses
  - Careful treatment of correlations between them
- Dominated by stat. error (50 MeV) vs syst. (33 MeV)

# W Boson Mass

New world average:

$$M_W = 80399 \pm 23 \text{ MeV}$$

Ultimate precision:

**Tevatron: 15-20 MeV**

**LHC: unclear (5 MeV?)**

# Top Quark Production and Decay

- At Tevatron, mainly produced in pairs via the strong interaction

- Decay via the electroweak interactions  $\text{Br}(t \rightarrow Wb) \sim 100\%$   
Final state is characterized by the decay of the W boson

- Cross Sections at Tevatron and LHC:

- Tevatron: 7 pb
- LHC (7 TeV): 160 pb
- LHC (10 TeV): 400 pb
- LHC (14 TeV): 890 pb

# How to identify the top quark

**SM:  $t\bar{t}$  pair production,  $\text{Br}(t \rightarrow bW) = 100\%$  ,  $\text{Br}(W \rightarrow lv) = 1/9 = 11\%$**

|                       |                |  |
|-----------------------|----------------|--|
| <b>dilepton</b>       | <b>(4/81)</b>  | <b>2 leptons + 2 jets + missing <math>E_T</math></b> |
| <b>l+jets</b>         | <b>(24/81)</b> | <b>1 lepton + 4 jets + missing <math>E_T</math></b>  |
| <b>fully hadronic</b> | <b>(36/81)</b> | <b>6 jets</b>  |

**(here:  $l = e, \mu$ )**

# How to identify the top quark

**SM:  $t\bar{t}$  pair production,  $\text{Br}(t \rightarrow bW) = 100\%$  ,  $\text{Br}(W \rightarrow l\nu) = 1/9 = 11\%$**

**lepton+jets**       **(24/81)**   **1 lepton + 4 jets + missing  $E_T$**   
**fully hadronic**    **(36/81)**   **6 jets**

# Top Event Categories

# Finding the Top at Tevatron and LHC without b-quark identification

- Tevatron:
  - Top is overwhelmed by backgrounds:
  - Even for 4 jets S/B is only about 0.8
  - Use b-jets to purify sample
- LHC
  - Signal clear even without b-tagging: S/B is about 1.5-2

# Finding the b-jets

- Exploit large lifetime of the b-hadron
  - B-hadron flies before it decays:  $d=c\tau$ 
    - Lifetime  $\tau = 1.5 \text{ ps}^{-1}$
    - $d=c\tau = 460 \text{ } \mu\text{m}$
    - Can be resolved with silicon detector resolution

Achieve efficiency of about 40-50% and fake rate of 0.5-2% (at 50 GeV) at Tevatron

# The Top Cross Section

## Tevatron

- Measured using many different techniques
- Good agreement
  - between all measurements
  - between data and theory
- Precision:  $\sim 13\%$

## LHC:

- Cross section  $\sim 100$  times larger
- Measurement will be one of the first milestones (already with  $10 \text{ pb}^{-1}$ )
  - Test prediction
  - demonstrate good understanding of detector
- Expected precision
  - $\sim 4\%$  with  $100 \text{ pb}^{-1}$

# Top at LHC: very clean

- At  $\sqrt{s}=7$  TeV:
  - About  $200 \text{ pb}^{-1}$  surpass Tevatron top sample statistics
  - About  $20 \text{ pb}^{-1}$  needed for “rediscovery”

# Top Mass Measurement: $t\bar{t} \rightarrow (b\ell\nu)(bqq)$

- 4 jets, 1 lepton and missing  $E_T$ 
  - Which jet belongs to what?
  - Combinatorics!
- B-tagging helps:
  - 2 b-tags  $\Rightarrow$  2 combinations
  - 1 b-tag  $\Rightarrow$  6 combinations
  - 0 b-tags  $\Rightarrow$  12 combinations
- Two Strategies:
  - Template method:
    - Uses “best” combination
    - Chi2 fit requires  $m(t) = m(\bar{t})$
  - Matrix Element method:
    - Uses all combinations
    - Assign probability depending on kinematic consistency with top

# Top Mass Determination

## Inputs:

- Jet 4-vectors
- Lepton 4-vector
- Remaining transverse energy,  $p_{T,UE}$ :
  - $p_{T,v} = -(p_{T,l} + p_{T,UE} + \sum p_{T,jet})$

## Constraints:

- $M(l\nu) = M_W$
- $M(q\bar{q}) = M_W$
- $M(t) = M(\bar{t})$

## Unknown:

- Neutrino  $p_z$

## 1 unknown, 3 constraints:

- Overconstrained
- Can measure  $M(t)$  for each event:  $m_t^{reco}$
- Leave jet energy scale (“JES”) as free parameter

Selecting correct combination  
20-50% of the time

# Example Results on $m_{\text{top}}$

CDF Run II Preliminary 3.2 fb<sup>-1</sup>

$m_{\text{top}} =$   
 $173.7 \pm 0.8 (\text{stat}) \pm 1.6 (\text{syst}) \text{ GeV}$

3.6 fb<sup>-1</sup>

$\pm 1.0\%$

$m_{\text{top}} =$   
 $172.1 \pm 0.9 (\text{stat}) \pm 1.3 (\text{syst}) \text{ GeV}$

3.2 fb<sup>-1</sup>

$\pm 0.9\%$

# Combining $M_{\text{top}}$ Results

- Excellent results in each channel
  - Dilepton
  - Lepton+jets
  - All-hadronic
- Combine them to improve precision
  - Include Run-I results
  - Account for correlations
- **Uncertainty: 1.3 GeV**
  - Dominated by syst. uncertainties
- Precision so high that theorists wonder about what it's exact definition is!

Tevatron/LHC expect to improve precision to  $\sim 1$  GeV

# Implications for the Higgs Boson

LEPEWWG 03/09

Relation:  $M_W$  vs  $m_{\text{top}}$  vs  $M_H$

Standard Model still works!

$$m_H = 87^{+35}_{-26} \text{ GeV}$$

Indirect constraints:  
 $m_H < 163 \text{ GeV @95\%CL}$

# The Higgs Boson

- Electroweak Symmetry breaking caused by scalar Higgs field
- vacuum expectation value of the Higgs field  $\langle\Phi\rangle = 246 \text{ GeV}/c^2$ 
  - gives mass to the W and Z gauge bosons,
    - $M_W \propto g_W \langle\Phi\rangle$
  - fermions gain a mass by Yukawa interactions with the Higgs field,
    - $m_f \propto g_f \langle\Phi\rangle$
  - Higgs boson couplings are proportional to mass
- Higgs boson prevents unitarity violation of WW cross section
  - $\sigma(pp \rightarrow WW) > \sigma(pp \rightarrow \text{anything})$ 
    - $\Rightarrow$  illegal!
    - At  $\sqrt{s} = 1.4 \text{ TeV}$ !

Peter Higgs

$$A \approx g^2 \frac{E^2}{M_W^2}$$

$$A \approx -g^2 \frac{E^2}{M_W^2}$$

Terms which grow  
with energy cancel  
for  $E \gg M_H$

This cancellation  
requires  $M_H < 800 \text{ GeV}$

# The Higgs Boson

- Electroweak Symmetry breaking caused by scalar Higgs field
- vacuum expectation value of the Higgs field  $\langle\Phi\rangle = 246 \text{ GeV}/c^2$ 
  - gives mass to the W and Z gauge bosons,
    - $M_W \propto g_W \langle\Phi\rangle$
  - fermions gain a mass by Yukawa interactions with the Higgs field,
    - $m_f \propto g_f \langle\Phi\rangle$
  - Higgs boson couplings are proportional to mass
- Higgs boson prevents unitarity violation of WW cross section
  - $\sigma(pp \rightarrow WW) > \sigma(pp \rightarrow \text{anything})$ 
    - => illegal!
    - At  $\sqrt{s} = 1.4 \text{ TeV}$ !

Peter Higgs

**Something new must happen at the LHC!**

$$A \approx g^2 \frac{E^2}{M_W^2}$$

$$A \approx -g^2 \frac{E^2}{M_W^2}$$

Terms which grow with energy cancel for  $E \gg M_H$

This cancellation requires  $M_H < 800 \text{ GeV}$

# Higgs Production: Tevatron and LHC

Tevatron

LHC

dominant:  $gg \rightarrow H$ , subdominant:  $HW$ ,  $HZ$ ,  $Hq\bar{q}$

# Higgs Boson Decay

- Depends on Mass
- $M_H < 130 \text{ GeV}/c^2$ :
  - $b\bar{b}$  dominant
  - $WW$  and  $\tau\tau$  subdominant
  - $\gamma\gamma$  small but useful
- $M_H > 130 \text{ GeV}/c^2$ :
  - $WW$  dominant
  - $ZZ$  cleanest

# How to make a Discovery

- This is a tricky business!
  - Lot's of complicated statistical tools needed at some level
- But in a nutshell:
  - Need to show that we have a signal that is inconsistent with being background
    - Number of observed data events:  $N_{\text{Data}}$
    - Number of estimated background events:  $N_{\text{Bg}}$
  - Need number of observed data events to be inconsistent with background fluctuation:
    - Background fluctuates statistically:  $\sqrt{N_{\text{Bg}}}$
  - Significance:  $S/\sqrt{B} = (N_{\text{Data}} - N_{\text{Bg}})/\sqrt{N_{\text{Bg}}}$ 
    - Require typically  $5\sigma$ , corresponds to probability of statistical fluctuation of  $5.7 \times 10^{-7}$
    - Increases with increasing luminosity:  $S/\sqrt{B} \sim \sqrt{L}$
    - All a lot more complex with systematic uncertainties...

# A signal emerging with time

$$\int L dt = 0.1 \text{ fb}^{-1} \text{ (year: 2008/2009)}$$

- Expected Events:
  - $N_{\text{higgs}} \sim 2$ ,  $N_{\text{background}} = 96 \pm 9.8$
  - $S/\sqrt{B} = 0.2$
- No sensitivity to signal

# A signal emerging with time...

$$\int L dt = 1 \text{ fb}^{-1} \text{ (year: } \sim 2009\text{)}$$

- Expected Events:
  - $N_{\text{higgs}} \sim 25$ ,  $N_{\text{background}} \sim 960 \pm 30$
  - $S/\sqrt{B} = 0.8$
- Still no sensitivity to signal

# There it is!

$$\int L dt = 30 \text{ fb}^{-1} \text{ (year: 2011/2012?)}$$

- Expected Events:
  - $N_{\text{higgs}} \sim 700$ ,  $N_{\text{background}} = 28700 \pm 170$
  - $S/\sqrt{B} = 4.1$
- Got it!!!

**High Mass:  $m_H > 140 \text{ GeV}$**

$$H \rightarrow WW^{(*)} \rightarrow l^+ l^- \nu \bar{\nu}$$

- Higgs mass reconstruction impossible due to two neutrinos in final state
- Make use of spin correlations to suppress WW background:
  - Higgs is scalar: spin=0
  - leptons in  $H \rightarrow WW^{(*)} \rightarrow l^+ l^- \nu \bar{\nu}$  are collinear
- Main background: WW production

10x 160 GeV Higgs

# $H \cdot WW^{(*)} \cdot l^+ l^- \nu \nu$ ( $l=e, \mu$ )

- **Event selection:**
  - 2 isolated  $e/\mu$  :
    - $p_T > 15, 10$  GeV
  - Missing  $E_T > 20$  GeV
  - Veto on
    - Z resonance
    - Energetic jets
- **Separate signal from background**
  - Use matrix-element or Neural Network discriminant to enhance sensitivity
- **Main backgrounds**
  - SM WW production
  - Top
  - Drell-Yan
  - Fake leptons
- **No sign of Higgs boson found yet**

# Limits on the Higgs boson cross section

- Lack of observation
  - $\Rightarrow$  an upper limit on the Higgs cross section
  - I.e. if the cross section was large we would have seen it!
- Results presented typically as ratio:
  - Experimental limit / theoretical cross section
  - If this hits 1.0 we exclude the Higgs boson at that mass!
- In this example from CDF: a factor 1.3 above SM cross section
  - at  $M_H = 165 \text{ GeV}/c^2$

## Tevatron vs LHC for $gg \rightarrow H$

| $m_H$   | Tevatron | LHC<br>7 TeV | LHC<br>10 TeV | LHC<br>14 TeV |
|---------|----------|--------------|---------------|---------------|
| 120 GeV | 1.1 pb   | 17 pb        | 32 pb         | 55 pb         |
| 160 GeV | 0.4 pb   | 9.2 pb       | 18 pb         | 33 pb         |

- Cross sections  $\sim 20$  times larger at LHC compared to Tevatron
  - Rather strong rise as process is  $gg$  initiated
- Backgrounds arise from  $qq$  processes
  - Signal/Background better at LHC than Tevatron

## Conclusions of 3<sup>rd</sup> Lecture

- Higgs boson most *wanted* particles
  - LHC must either find it or find something else
- Within the Standard Model constraints from precision electroweak measurements
  - $m_W = 80.399 \pm 0.023 \text{ GeV}/c^2$
  - $M_{\text{top}} = 173.1 \pm 1.3 \text{ GeV}/c^2$
  - $m_H$  between 114 and 157  $\text{GeV}/c^2$
